DETAILED ACTION

Response to RCE Amendment

This Office Action is in response to applicant's amendment filed on November 7, 2006. Claim 1 has been amended. Claims 1, 4, 12, and 23 are pending. Applicant's comments relating to the Witherow reference applied in the previous Office Action are acknowledged. The claims, as amended, have been carefully considered but are being rejected in the following manner in view of Reiley et al to U.S. Patent No. 6,248,110.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1, 4, 12, and 23 are rejected under 35 U.S.C. 102(e) as being anticipated by Reiley et al (U.S. Patent No. 6,248,110). Reiley et al discloses in Figures 1 and 2 a vertebral body (26) includes an exterior forms from compacted cortical bone (28) which encloses an interior volume (30) of cancellous bone (32). Figure 4 illustrates a tool (48) comprising a catheter tube (50) having a distal end (54) where at the distal end (54) carries an expandable body (56). Figure 5K(1) illustrates the catheter (50) introduced into the interior volumn (30) occupied in the cancellous bone (32) and the expandable body (56) expanding on one side of the

distal end of the catheter (50). With regards to the platform, as recited, the Reiley et al the part at the distal end (54) where the suction holes (88) inherently serves as a barrier to inhibiting the expandable body (56) from expanding in more than one direction. Figure 7 illustrates the injector tip (90) occupying in cavity (84) while the expandable body (56) collapses and the injector tip (90) injects filler material into the cavity (84). The Reiley et al device would inherently perform steps recited in method claim 1. With regards to claim 12, bone filling material, such as artificial bone substitute or flowable synthetic bone material or methyl methacrylate bone cement is known in the art of bone filling.
